Your Waist-to-Height Check-In

A simple number. A bigger conversation.

Your body is always giving you feedback.

Energy. Hunger. Sleep. Digestion. Recovery.

Your waist measurement can be another signal—not a judgment, not a diagnosis, and not a measure of your worth.

This tool compares your waist size to your height. It helps you see whether your waist is less than half your height, a commonly used screening guideline for central body-fat distribution and cardiometabolic risk.

The goal is not perfection.
The goal is awareness.

How It Works

1. Measure your height.
2. Measure your waist at the midpoint between the bottom of your ribs and the top of your hip bones.
3. Measure after a normal exhale—do not suck in or pull the tape tight.
4. Use the same unit for both measurements: inches or centimetres.
5. Enter both numbers below.

Your Result

Waist-to-Height Ratio = Waist ÷ Height

A simple reminder:

Keep your waist measurement to less than half of your height.

What Your Number May Mean

Below 0.50
You are within the commonly used lower-risk range. Keep building habits that support energy, recovery, strength, food awareness, and a life you enjoy living.

0.50–0.59
This may be a signal to become more curious about your health patterns. Look beyond the number: How is your sleep? Energy? Hunger? Blood work? Stress? Recovery?

0.60 and above
This may signal a higher level of health risk related to abdominal fat distribution. It is worth speaking with a qualified healthcare professional, especially if you have concerns about blood pressure, blood sugar, cholesterol, sleep apnea, or family history.

Important Reminder

This is a **screening tool**, not a diagnosis.

Your body is more than one measurement. Muscle mass, genetics, age, medications, stress, health history, sleep, and lifestyle all matter.

Use this number as information—not ammunition against yourself.

Your Next Step

Don’t ask, “How do I force this number down?”

Ask:

“What is my body asking for more of right now?”

Better food awareness.
More consistent meals.
Better recovery.
Less all-or-nothing thinking.
Training that supports your nervous system instead of draining it.

Call to Action

Take your number. Then bring the conversation to the Open Floor.

Share your result, your goal, or the one body signal you are ready to understand better.

This is not about chasing a smaller body.
It is about building a stronger relationship with the one you live in.
